Mr. Damico: here is the latest advice from our statistical methodology staff:

"Alan and Bob,

The appropriate variables for him to use would be borough and segment. That should get close to the appropriate standard errors, but will never match exactly. Our Taylor series procedure is a bit different from the one that a user could access through SASS, so the results will not match up. Our method tries to take into account certain properties of the weighting procedure as well as the sample design so we have not been using the SASS procedure.**"**

Unfortunately, it seems that what we're able do here is propitiatory & unable to be replicated.
